

Curing / Hardening Crochet Basket

To give the desired shape to a ready made basket, it is recommended to cure it in a water-PVA glue solution.

PVA glue become transparent when dry and makes the cured basket very solid when completely dry.

The solution is made with 50% glue and 50% water. Amount depends on number and size of items to be cured. The amount of solution is needed only to saturate the basket (no need to completely deep the basket in solution).

(100ml glue /100 ml water is usually enough for 1-3 smaller baskets).

It takes 10-15 minutes to cure the basket, then it may take from 1-5 days for the basket to completely dry up. This depends on yarn the basket is made of and weather conditions.

The ready basket doesn't need special care, and can be cleaned with dry brush.

It is important to give a basket the desired shape when it is still wet, as when it dries up it may be too late))))))

The cured and not cured baskets look and feel very different, and I would definitely choose to cure))))), but if you are not sure about result, it is recommended to try on a small sample, mixing just table spoon of glue and table spoon of water and waiting for the sample to become completely dry and solid. Now if you are ready, let's start!))))))

Curing (hardening) the basket

1

We will need:
-Plastic bowl
-PVA glue
(1part)
-Water (1 part)
-Gloves
-Plastic Bag
(medium or
large size)

2

Mix glue and wa-
ter in the bowl.

3

Immerse the
basket into the
solution
and leave for
few minutes to
soak well from all
sides.

4

Take out and
let the excess of
moisture to flow
down, so it stops
dripping.
Then give a bas-
ket desired shape
(do not forget
about the frill).

5

Place the plastic bag inside the basket and fill it in with something like old newspapers or used plastic bags or old clothes (one by one).

6

Give basket desired shape and let it dry;
Hang it up or turn around from time to time, so the glue dries up evenly from all sides.

7

Flatten the bottom slightly when still wet, so the basket will remain steady in required standing position. (Optional)

When the basket dries up, remove the items out of the bag

one by one; then remove the bag; and let it dry inside the basket.

PVA glue turns transparent when completely dry.

If some areas seem different shade, that means more time is needed to dry up the shell.

For a hanging basket find the desired position; attach the string from inside, and make 2-3 knots at the end of the string (inside the basket).

Ready!)))
